

Revenue Performance & Customer Value Risk

Why 121% growth may
not be sustainable

Revenue Risk 01

Revenue is Growing But Customer Value is Eroding

Total Revenue
\$8.55M

YoY → 121% ▲

AOV per
Customer YoY

- 8.44% ▼

Customer
Growth YoY

142% ▲

Avg Order
Frequency YoY

-10.34% ▼

Revenue has increased significantly, but the quality of that growth is weakening. While customer acquisition has accelerated, individual customer value and engagement have declined, signaling a shift toward volume-driven growth that may not be sustainable.

So what's driving this
decline in customer value 

What drove the decline in customer value?

Top Tier
Revenue 2024

\$1.15M

Top Tier
Revenue 2025

\$911.5k

Revenue Loss

- 20%

\$235.7k

Top-tier customers from 2024 are deteriorating significantly in 2025, with a 64% decline rate which lead to a ~20% drop in revenue contribution. While mid and low-tier segments show growth in 2025, this expansion is not fully compensating for the loss of high-value customers.

The decline in customer value is primarily driven by the mass decline of top-tier accounts.

Revenue Growth Was Sustained by Lower-Value Customer Expansion

Customer Tier Movement (2024 → 2025)				
2024 → 2025	Top	Mid	Low	Churn
Top	17	5	3	
Mid	18	15	1	3
Low	16	19	18	9

Revenue growth was sustained by strong expansion in low-tier and mid-tier customer segments. While revenue continued to grow, the business became increasingly dependent on lower-value customer expansion rather than strengthening high-value customer relationships.

Revenue Risk 02

Revenue trend is inconsistent and spike-driven

The March 2024 spike was short-lived and never sustained

2025 began weak, surged sharply in May, then dropped heavily in August

2025 closed with another sharp spike, driving +72% MoM growth

What drove the revenue spike in March 2024?

Revenue Distribution by Region – March 2024

Top 5 Customers – March 2024

March 2024 revenue grew +134%, driven by heavy concentration in the West (~42%) and a single customer (~35%), indicating dependency-driven growth.

The absence of sustained momentum confirms the spike was transactional, not structural.

The same pattern occurred again in December 2025

Revenue Distribution by Region – December 2025

Top 5 Customers – December 2025

The volatility observed in December 2025 is not new. A similar concentration pattern in March 2024 shows that revenue growth has consistently depended on a narrow set of customers and regions rather than scalable drivers.

This confirms a recurring, dependency-driven growth model that exposes the business to high revenue volatility and limits long-term scalability.

Growth Strategy:

Shift from
volume →
value-driven
growth

Retention

Recover
top-tier
customers

Value Growth

Increase
AOV &
frequency

Risk Reduction

Diversify
customers
& regions

Expansion

Convert
mid-tier
to top-tier
